INTRODUCTION

This is the fifty-fifth annual report of the U.S. Tariff Commission on domestic production and sales of synthetic organic chemicals and the raw materials from which they are made. It is authorized under the provisions of section 332 of the Tariff Act of 1930, as amended. The report consists of fourteen sections, each covering a specified group (based principally on use) of organic chemicals as follows: tar and tar crudes; crude products from petroleum and natural gas; intermediates; dyes; pigments; medicinal chemicals; flavor and perfume materials; plastics and resin materials; rubber-processing chemicals; elastomers; plasticizers; surface-active agents; pesticides and related products; and miscellaneous organic chemicals. Data have been supplied by more than 800 producers.

The first table in each section gives statistics on products and groups of products in as great detail as is possible without revealing the operations of individual producers. Statistics for an individual chemical or group of chemicals are given only when there are three or more producers, no one or two of which may be predominant. Moreover, even when there are three or more producers, statistics are not given if there is any possibility that their publication would violate the statutory provisions relating to unlawful disclosure of information accepted in confidence by the Commission. [1]

Data are reported by producers for only those items where the volume of production or sales exceeds 1,000 pounds or the value of sales exceeds $1,000. They are usually given in terms of undiluted materials; however, products of 95 percent or more purity are considered to be 100 percent pure. Commercial concentrations are applied to dyes, certain plastics and resins, and a few solvents; such concentrations are specifically noted.

The statistics given in this report include data from all known domestic producers of the items covered and include the total output of each company's plants, i.e., the quantities produced for consumption within the producing plant, as well as the quantities produced for domestic and foreign sale. The quantities reported as produced, therefore, generally exceed the quantities reported as sold. Some of these differences, however, are attributable to changes in inventory.

The second table in each section lists all items for which data on production or sales have been reported, by primary manufacturers, identified by manufacturers' codes. Each code consists of not more than three capital letters which is assigned on a permanent basis. The third table in each section is a directory, alphabetized by the codes of the manufacturers reporting in that section. Table 1 of the Appendix is a directory, alphabetized by the names of the manufacturers reporting in all sections and includes their office addresses.

Information on the synonymous names of the organic chemicals included in this report may be found in the *SOCMA Handbook: Commercial Organic Chemical Names*, published by the Chemical Abstracts Service of the American Chemical Society, or the *Colour Index* (2d edition), published by the Society of Dyers and Colourists.

Table 2 of the Appendix summarizes and gives the competitive status of U.S. general imports in 1971 of benzenoid intermediates and finished benzenoid products, entered under schedule 4, parts 1B and 1C, of the Tariff Schedules of the United States.

As specified in the reporting instructions sent to manufacturers, production and sales (unless otherwise specified) are defined as follows:

> *PRODUCTION is the total quantity of a commodity made available by original manufacturers only. It is the sum--expressed in terms of 100% active ingredient unless otherwise specified in the reporting instructions--of the quantities:*
>
> *Produced, separated, and consumed in the same plant or establishment. A commodity is considered separated when it is isolated from the reaction system and/or when it is weighed, analyzed, or otherwise measured. This includes byproducts and coproducts that are not classifiable as waste materials;*
>
> *Produced and transferred to other plants or establishments of the same firm;*
>
> *Produced and sold to other firms, including production for another under a toll agreement (i.e., an agreement, under which one firm furnishes the raw materials and pays the processing costs and the other firm prepares the finished product and returns it to the first firm).*
>
> *Produced and held in stock.*

[1] Title 18, U.S.C. 1905 and Title 44, U.S.C. 3508

PRODUCTION EXCLUDES;

Purification of a commodity, unless inclusion of such processing is specifically requested in the reporting instructions for individual sections;
Intermediate products which are formed in the manufacturing process, but are not isolated from the reaction system--that is, not weighed, analyzed, or otherwise measured;
Materials that are used in the process but which are recovered for re-use or sale;
Waste products having no economic significance.

SALES are actual quantities of commodities sold by ORIGINAL MANUFACTURERS ONLY. Sales include the quantity and value of:
Shipments of a commodity for domestic use and for export, or segregation in a warehouse when title has passed to the purchaser in a bona fide sale;
Shipments of a commodity produced by others under toll agreements;
Shipments to subsidiary or affiliated companies.

SALES EXCLUDE:
All intra-company transfers within a corporate entity;
All sales of purchased commodities;
All shipments of a commodity produced for others under toll agreements.

VALUE OF SALES is the net selling value f.o.b. plant or warehouse, or delivered value, whichever represents the normal industry practice.

SUMMARY

Combined production of all synthetic organic chemicals, tars, tar crudes, and crude products from petroleum and natural gas in 1971 was 237,961 million pounds--an increase of 2.1 percent over the output in 1970 (see table 1). Sales of these materials in 1971, which totaled 133,665 million pounds, valued at $14,119 million, were 4.0 percent larger than in 1970 in terms of quantity and 3.5 percent larger in terms of value. These figures include data on production and sales of chemicals measured at several successive steps in the manufacturing process, and therefore they necessarily reflect some duplication.

In 1971, production of all synthetic organic chemicals, including cyclic intermediates and finished chemical products, totaled 142,503 million pounds, or 3.0 percent more than the output in 1970. Production increased in 1971 compared to 1970 for ten subgroups of products. Plasticizers (1,494 million pounds) was 11.8 percent more; pesticides and related products (1,136 million pounds) was 9.8 percent more; plastics and resin materials (21,071 million pounds) was 9.7 percent larger; rubber-processing chemicals (323 million pounds) increased in 1971 by 8.4 percent; cyclic intermediates (29,953 million pounds) was 6.0 percent more.

Production of several other groups was also larger in 1971 than in 1970. Medicinal chemicals, elastomers, and dyes each increased by approximately 4 percent while organic pigments (58 million pounds) was 3.2 percent larger and miscellaneous chemicals (79,460 million pounds) increased by 0.3 percent. Production of two groups of synthetic organic chemicals was smaller in 1971 than in 1970. Output of flavor and perfume materials (96 million pounds) declined 3.9 percent and the output of surface-active agents (3,828 million pounds) declined 1.5 percent.

SYNTHETIC ORGANIC CHEMICALS, 1971

GENERAL

In this report, synthetic organic chemicals are classified on the basis of their principal use as follows: cyclic intermediates, dyes, organic pigments, medicinal chemicals, flavor and perfume materials, plastics and resin materials, rubber-processing materials, elastomers, plasticizers, surface-active agents, pesticides and related products and miscellaneous chemicals (acyclic intermediates and acyclic and cyclic finished products). Most of these groups are further subdivided either by use or by chemical composition. As intermediate chemicals are used in the manufacture of finished products, aggregate figures that cover both intermediates and finished products necessarily include considerable duplication.

Total production of synthetic organic chemicals (intermediates and finished products combined) in 1971 was 142,503 million pounds, or 3.0 percent more than the output of 138,322 million pounds reported for 1970 and 36.1 percent more than the output of 104,711 million pounds reported for 1967 (see table 2). Sales of synthetic organic chemicals in 1971 amounted to 79,137 million pounds, valued at $12,883 million, compared with 74,794 million pounds, valued at $12,409 in 1970 and 55,177 million pounds, valued at $10,438 million in 1967. Production of all cyclic products (intermediates and finished products combined) in 1971 totaled 46,273 million pounds, or 7.0 percent more than the 43,245 million pounds reported for 1970 and 38.2 percent more than the 33,479 million pounds reported for 1967. Production of all acyclic products in 1971 totaled 96,230 million pounds, or 1.2 percent more than the 95,077 million pounds reported for 1970 and 35.1 percent more than the 71,232 million pounds reported for 1967.

TAR AND TAR CRUDES

Tar

Coal tar is produced chiefly by the steel industry as a byproduct of the manufacture of coke; water-gas tar and oil-gas tar are produced by the fuel-gas industry. Production of coal tar, therefore, depends on the demand for steel; production of water-gas tar and oil-gas tar reflects the consumption of manufactured gas for industrial and household use. Water-gas and oil-gas tars have properties intermediate between those of petroleum asphalts and coal tars. Petroleum asphalts are not usually considered to be raw materials for chemicals.

The quantity of tar produced in the United States in 1971 was almost entirely coal tar which amounted to 679 million gallons, or 10.7 percent less than the 761 million gallons produced in 1970 (see table 1[1]). U.S. production of water-gas and oil-gas tars was not reported to the Commission for 1970 or 1971; production of these tars amounted to 21 million gallons in 1968, according to trade publications. Sales of coal tar in 1971 amounted to 334 million gallons valued at $36 million, compared with 371 million gallons, valued at $36 million, in 1970.

Consumption of tar in 1971 amounted to 686 million gallons, of which 572 million gallons was consumed in distillation and (by tar distillers only) in other uses. Tar used as fuel amounted to 112 million gallons. A lesser amount, 1.6 million gallons, was consumed by coke-oven operators in miscellaneous uses (see table 1A).

Tar Crudes

Tar crudes are obtained from coke-oven gas and by distilling coal tar, water-gas tar, and oil-gas tar. The most important tar crudes are benzene, toluene, xylene, naphthalene, creosote oil, and pitch of tar. Some of these products are identical with those obtained from petroleum. Data for materials derived from petroleum are included, for the most part, with the statistics for like materials derived from coke-oven gas and tars, and are shown in tables 1 and 1B.

Domestic production of industrial and specification grades of benzene reported by coke-oven operators and petroleum refinery operators[2] in 1971 amounted to 1,076 million gallons--5.1 percent less than the 1,134 million gallons reported for 1970. These statistics include data for benzene produced from light oil and petroleum. Sales of benzene by coke-oven operators and petroleum operators in 1971 amounted to 593 mil-

[1] See also table 2 of this section which lists the products in table 1 and identifies the manufacturers by code. These codes are given in table 3.

[2] Statistics on production and sales of benzene, toluene, and xylene by tar distillers cannot be shown because publication would reveal the operations of individual companies.

lion gallons, valued at $119 million, compared with 654 million gallons, valued at $143 million, in 1970. In 1971 the output of toluene[2] (including material produced for use in blending in aviation fuel) amounted to 876 million gallons--5.6 percent more than the 830 million gallons reported for 1970. Sales of toluene in 1971 were 484 million gallons, valued at $80 million, compared with 430 million gallons, valued at $77 million, in 1970. The output of xylene[2] in 1971 (including that produced for blending in motor fuels) was 612 million gallons, compared with 538 million gallons in 1970. About 99 percent of the 612 million gallons of xylene produced in 1971 was obtained from petroleum sources.

Production of crude naphthalene in 1971 (including 258 million pounds of petroleum-derived naphthalene) amounted to 619 million pounds, compared with 719 million pounds in 1970. In 1971 the output of creosote oil for wood preservation was 142 million gallons (100 percent creosote basis), compared with 129 million gallons in 1970. Production of road tar in 1971 was 40 million gallons, compared with 53 million gallons in 1970.

Some of the products obtained from tars and included in the statistics in table 1 are derived from other products for which data are also included in the table. The statistics, therefore, involve considerable duplication, and for this reason no group totals or grand totals are given. It is estimated, that, after duplication has been eliminated insofar as possible, the net value of the output (from all sources) of these products and of tar burned as fuel was $617 million in 1971, compared with $634 million in 1970 and $640 million in 1969. The total value of sales of those products derived from coke-oven gas and tars shown in table 1 (exclusive of coal tar itself), amounted to $123 million in 1971, compared with $132 million in 1970.

See footnote 2 on page 1.

[1] Unit value per gallon, pound, or ton, as specified.

[2] Includes only data for coal tar reported to the Division of Fossil Fuels, U.S. Bureau of Mines. Data on U.S. production of water-gas tar and oil-gas tar are not collected by the Tariff Commission, but according to trade publications, production of these tars amounted to 21 million gallons in 1968.

[3] Data reported by tar distillers are not included because publication would disclose the operations of individual companies. Production of benzene, toluene, and xylene by tar distillers decreased in 1971, compared with 1970. The annual production statistics for petroleum operators on benzene, toluene, and xylene are not comparable with the combined monthly production figures, because of fiscal year revisions.

Note.--Statistics for materials produced in coke and gas-retort ovens are compiled by the Division of Fossil Fuels, U.S. Bureau of Mines, Department of the Interior. Statistics for materials produced in tar and petroleum refineries are compiled by the U.S. Tariff Commission.

[5] Statistics represent combined data for the commercial grades of naphthalene. Because of conversion of naphthalene from one grade to another, the figures may include some duplication.
[6] Statistics include data only for creosote oil sold for, or used in, wood preserving.
[7] In 1971, production of coal-tar solution containing creosote (100% solution basis) amounted to 39,489 thousand gallons; sales were 36,126 thousand gallons, valued at 6,466 thousand dollars, with a unit value of $0.18 per gallon.

CRUDE PRODUCTS FROM PETROLEUM AND NATURAL GAS FOR CHEMICAL CONVERSION

Crude products that are derived from petroleum and natural gas[1] are related to the intermediates and finished products made from such crudes in much the same way that crude products derived from the distillation of coal tar are related to their intermediates and finished products. Many of the crude products derived from petroleum are identical with those derived from coal tar (e.g., benzene, toluene, and xylene). Considerable duplication exists in the statistics on the production and sales of petroleum crudes because some of these crude chemicals are converted to other crude products derived from petroleum and because data on some production and sales are reported at successive stages in the conversion process. Notwithstanding these duplications, the statistics are sufficiently accurate to indicate trends in the industry and to serve as a basis for general comparison. Many of the crude products for which data are included in the statistics may be used either as fuel or as basic materials from which to derive other chemicals, depending on prevailing economic conditions; but in this report every effort has been made to exclude data on materials that are used as fuel; however, data are included on toluene and xylene which are used in blending aviation and motor fuel.

The output of crude products derived from petroleum and natural gas as a group amounted to 81,043 million pounds in 1971, or 4.1 percent more than the 77,879 million pounds reported for 1970 (table 1).[2] The larger output in 1971 is accounted for chiefly by increased production of propane. There were small increases in production of n-butane, xylenes, ethylene, propylene, and 1,3-butadiene. Sales of crude chemicals from petroleum in 1971 amounted to 45,752 million pounds, valued at $1,078 million, compared with 43,439 million pounds, valued at $1,061 million, in 1970.

The output of aromatic and naphthenic products from petroleum amounted to 21,449 million pounds in 1971, compared with 21,079 million pounds in 1970. Sales in 1971, which amounted to 13,646 million pounds, valued at $308 million, were 75 million pounds larger, and valued at $15 million less than those in 1970. The output of 1^0 and 2^0 benzene from petroleum amounted to 7,388 million pounds in 1971--3.7 percent less than the 7,675 million pounds produced in 1970. The output of toluene in 1971 was 6,273 million pounds--6.2 percent more than the 5,907 million pounds produced in 1970. Production of xylene was 4,394 million pounds in 1971, compared with 3,844 million pounds in 1970. These figures include toluene and xylene used in blends in aviation and motor-grade gasolines. Production of naphthalene was 258 million pounds in 1971, compared with an output of 291 million pounds in 1970. The output of naphthenic acids in 1971 amounted to 29.4 million pounds, an increase of 4.8 million pounds over 1970.

---

[1] Statistics on aromatic chemicals from coal tar are given in the report on "Tar and Tar Crudes".

[2] See also table 2 which lists these products and identifies the manufacturers by codes. These codes are given in table 3.

Production of all aliphatic hydrocarbons and derivatives from petroleum and natural gas was 59,594 million pounds in 1971, compared with 56,800 million pounds in 1970. Sales of these products were 32,106 million pounds, valued at $769 million, in 1971 compared with 29,868 million pounds, valued at $738 million in 1970. The statistics on production of acetylene include only acetylene produced from hydrocarbons and used as raw material in the production of other chemicals. Total production of acetylene for chemical synthesis is reported to the U.S. Bureau of the Census. In 1971, production of acetylene from hydrocarbon sources, amounted to 356 million pounds. Production of ethylene was 18,450 million pounds in 1971--2.0 percent more than the 18,089 million pounds produced in 1970. The output of propylene and propane-propylene mixture was 6,891 million pounds in 1971--3.8 percent more than the 6,641 million pounds produced in 1970. Production of 1,3-butadiene, one of the principal ingredients of S-type synthetic rubber, was 3,340 million pounds in 1971, compared with 3,101 million pounds in 1970. The output of 1,3-butadiene in 1971 was the largest on record.

The following tabulation shows the number of companies that reported production of organic chemical crudes in 1971.

Chemical group	*Number of companies*
Tar crudes----------	13

CYCLIC INTERMEDIATES

Cyclic intermediates are synthetic organic chemicals derived principally from petroleum and natural gas and from coal-tar crudes produced by destructive distillation (pyrolysis) of coal. Most cyclic intermediates are used in the manufacture of more advanced synthetic organic chemicals and finished products, such as dyes, medicinal chemicals, elastomers (synthetic rubbers), pesticides, and plastics and resin materials. Some intermediates, however, are sold as end products without further processing. For example, refined naphthalene may be used as a raw material in the manufacture of 2-naphthol or of other more advanced intermediates, or it may be packaged and sold as a moth repellent or as a deodorant. In 1971 about four-tenths of the total output of cyclic intermediates was sold; the rest was consumed chiefly by the producing plants in the manufacture of more advanced intermediates and finished products.

Total production of cyclic intermediates (table 1)[1] in 1971--29,953 million pounds--was the largest on record, and was 6.0 percent larger than the output of 28,257 million pounds reported for 1970. The larger output of cyclic intermediates in 1971 reflects the increased demand by the chemical products industries, particularly those industries that produce plastics materials, dyes, pigments, and plasticizers. Sales of cyclic intermediates in 1971, however, were less than those in 1970. Sales in 1971 amounted to 12,971 million pounds, valued at $1,252 million, compared with 12,976 million pounds, valued at $1,260 million, in 1970.

Production of ethylbenzene in 1971 was 4,984 million pounds, or 3.2 percent more than the 4,827 million pounds reported for 1970. Output of styrene in 1971 was 4,682 million pounds, an increase of 8.0 percent from the 4,335 million pounds in 1970. Other intermediates whose production exceeded 1 billion pounds in 1971 were cumene (2,144 million pounds), phenol (1,784 million pounds), cyclohexane (1,748 million pounds), dimethyl terephthalate (1,739 million pounds), p-xylene (1,662 million pounds), and terephthalic acid (1,582 million pounds). The output of other large-volume intermediates in 1971 compared with 1970 were: Phthalic anhydride, 794 million pounds (8.2 percent more than in 1970); o-xylene, 785 million pounds (1.7 percent less); cyclohexanone, 756 million pounds (5.9 percent larger); straight chain alkylbenzenes, 550 million pounds (0.6 percent smaller); nitrobenzene, 445 million pounds (18.8 percent smaller); and isocyanates, 507 million pounds (1.1 percent smaller). Production of chlorobenzene amounted to 409 million pounds (15.7 percent less than in 1970), and production of aniline was 366 million pounds, a decrease of 8.1 percent from 1970. The above 16 chemicals accounted for 83 percent of the total output of cyclic intermediates in 1971.

DYES

Domestic synthetic dyes are derived in whole or in part from cyclic intermediates. Approximately two-thirds of the dyes consumed in the United States are used by the textile industry to dye natural and synthetic fibers or fabrics; about one-sixth is used for coloring paper; and the rest is used chiefly in the production of organic pigments and in dyeing of leather and plastics. Of the several thousand different synthetic dyes that are known, more than one thousand are manufactured by one or more domestic producers. The large number of dyes results from the many different types of materials to which dyes are applied, the different conditions of service for which dyes are required, and the costs that a particular use can bear. Dyes are sold as pastes, powders, lumps, and solutions; concentrations vary from 6 percent to 100 percent. The concentration, form, and purity of a dye are determined largely by the use for which it is intended.

Total domestic producton of dyes in 1971 amounted to 244 million pounds, or 3.9 percent more than the 235 million pounds produced in 1970 (table 1).[1] Sales of dyes in 1971 amounted to 230 million pounds, valued at $423 million, compared with 223 million pounds, valued at $390 million, in 1970. In terms of quantity, sales of dyes in 1971 were 2.8 percent larger than in 1970 and in terms of value, 8.2 percent larger. The average unit value of sales of all dyes in 1971 was $1.84 a pound, compared with $1.75 in 1970.

For many important dyes, production was larger in 1971 than in 1970: Acid Yellow 151 production increased 54.3 percent, from 843,000 pounds in 1970 to 1,301,000 pounds in 1971; Disperse Yellow 3 output increased 32.5 percent, from 1,870,000 pounds in 1970 to 2,478,000 pounds in 1971. Other important dyes whose output in 1971 was substantially larger than in 1970 were Disperse Blue 79 (29.6 percent increase), Direct Black 38 (28.1 percent increase), Direct Blue 2 (24.3 percent increase), Direct Yellow 106 (15.5 percent increase), and Disperse Blue 3 (8.7 percent increase).

On the other hand, the output of several important dyes was smaller in 1971 than in 1970. Production of Vat Black 25 was 1,542,000 pounds in 1971, or 50.5 percent less than the 3,113,000 pounds produced in 1970. Production of Vat Green 3 in 1971 was 2,070,000 pounds, or 45.2 percent less than the 3,780,000 pounds produced in 1970. The output of Vat Orange 1 was 45.1 percent smaller in 1971 than in 1970; that of Vat Yellow 2 was 39.4 percent smaller, that of FD and C Red No. 2 was 27.1 Percent smaller; that of Direct Blue 218 was 24.6 percent smaller; and that of Acid blue 9 was 21.4 percent smaller.

Table 1A summariezes production and sales of dyes in 1971 by class of application. Five application classes of dyes accounted for approx-

imately three-fourths of all the dyes produced in 1971. Vat dyes accounted for 20.9 percent of the total; disperse dyes, for 14.3 percent; direct dyes, for 14.2 percent; fluorescent brighteners, for 12.2 percent; and acid dyes, for 11.0 percent. Of these five classes of dyes, the output of Vat dyes was 9.8 percent smaller in 1971 than in 1970, and the output of fluorescent brighteners was 4.8 percent smaller. The output of disperse dyes, however, was 20.5 percent larger in 1971 than in 1970; the output of acid dyes was 16.1 percent larger; and the output of direct dyes was 7.6 percent larger.

Of the remaining classes, the output of fiber-reactive dyes in 1971 was 66.1 percent more than the 1970 production; that of azoic compositions was 33.2 percent larger in 1971 than in 1970; and that of basic dyes was 14.7 percent larger in 1971. Production of mordant dyes decreased 28.9 percent in 1971 from the 1970 output; food, drug and cosmetic colors decreased 9.3 percent in 1971; and solvent dye output in 1971 was 7.2 percent less than the 1970 output.

Table 1B shows production and sales of dyes, by chemical class. In 1971, three chemical classes of dyes accounted for about two-thirds of all dyes produced: Azo dyes accounted for 33.7 percent of the total; anthraquinone dyes, for 19.4 percent; and stilbene dyes, for 13.2 percent. The output of azo dyes was 13.7 percent larger in 1971 than in 1970, that of the stilbene dyes was 0.7 percent larger, and that of the anthraquinone dyes, 9.2 percent smaller. Of the remaining chemical classes for which statistics are published, the output of thiazole dyes was 55.7 percent larger in 1971 than in 1970; cyanine dyes 20.1 percent larger; oxazine dyes, 29.5 percent larger; methine dyes, 19.6 percent larger; quinoline dyes, 28.9 percent larger; azoic dyes and components, 25.4 percent larger; and phthalocyanine dyes, 3.2 percent larger. On the other hand, the output of the nitro dyes was 15.9 percent smaller in 1971 than in 1970; that of the xanthene dyes was 4.1 percent smaller, and that of the triarylmethane dyes was 3.1 percent smaller.

ORGANIC PIGMENTS

As the terms are used in this report, organic pigments are toners and lakes derived in whole or in part from benzenoid chemicals and colors. They are used in paints and related products, in printing inks, and in plastics and resin materials.

Statistics on production and sales of all organic pigments in 1971 are given in table 1. 1/ Statistics on sales of a few selected pigments by commercial forms (dry full-strength form, dry extended form, dry dispersons, aqueous dispersions, and flushed colors) are given in table 1A. Individual toners and lakes are identified in this report by the names used in the third edition of the Colour Index.

Total production of organic pigments in 1971 was 58.3 million pounds--3.2 percent more than the 56.5 million pounds produced in 1970 and 4.4 percent less than the 61.0 million pounds produced in 1969. Total sales of organic pigments in 1971 amounted to 47.1 million pounds, valued at $130.0 million, compared with 47.2 million pounds, valued at $123.0 million, in 1970 and 50.8 million pounds valued at $133.1 million, in 1969. In terms of quantity, sales of organic pigments in 1971 were 0.2 percent less than in 1970 and 7.4 percent less than in 1969; in terms of value, sales in 1971 were 5.7 percent more than in 1970 and 2.4 percent less than in 1969.

Production of toners in 1971 amounted to 55.1 million pounds--4.8 percent more than the 52.5 million pounds reported for 1970. Sales in 1971 were 44.2 million pounds, valued at $126.6 million, compared with 43.8 million pounds, valued at $119.4 million, in 1970. Sales in 1971 were thus 1.1 percent more than those in 1970 in terms of quantity, and 6.0 percent more in terms of value. The individual toners listed in the report which were produced in the largest quantities in 1971 were Pigment Yellow 12, 5.6 million pounds; Pigment Blue 15, beta form, 5.1 million pounds; and Pigment Red 49, barium toner, 4.3 million pounds.

Production of lakes totaled 3.2 million pounds in 1971--18.5 percent less than the 4.0 million pounds reported for 1970. Sales of lakes in 1971 amounted to 2.8 million pounds, valued at $3.4 million, compared with sales in 1970 of 3.4 million pounds, valued at $3.6 million. Sales in 1971 were thus 17.8 percent less than those in 1970 in terms of quantity, and 4.5 percent less in terms of value.

For each of 15 selected pigments, or groups of pigments, table 1A gives data on sales by commercial forms. Pigment Yellow 12, Pigment Red 90, and Pigment Blue 19 were sold principally in the flushed form. The remaining 12 pigments, or groups of pigments, for which statistics are published were sold principally in the dry full-strength form. Statistics on sales by commercial forms could not be published for Pigment Red 49, sodium toner, without revealing the operations of individual companies.

1/ See also table 2 which lists these products and identifies the manufacturers by codes. These codes are listed in table 3.

TABLE 1.--ORGANIC PIGMENTS: U.S. PRODUCTION AND SALES, 1971

[Listed below are all organic pigments for which any reported data on production or sales may be published. (Leaders are used where the reported data are accepted in confidence and may not be published or where no data were reported.) The abbreviations PMA and PTA stand for phosphomolybdic and phosphotungstic (including phosphotungstomolybdic) acid, respectively.

MEDICINAL CHEMICALS

Medicinal chemicals include the medicinal and feed grades of all organic chemicals having therapeutic value, whether obtained by chemical synthesis, by fermentation, by extraction from naturally occurring plant or animal substances, or by refining a technical grade product. They include antibiotics and other anti-infective agents, antihistamines, autonomic drugs, cardiovascular agents, central nervous system depressants and stimulants, hormones and synthetic substitutes, vitamins, and other therapeutic agents for human or veterinary use and for animal feed supplements.

Table 1 shows statistics for production and sales of medicinal chemicals grouped by pharmacological class, while table 2 lists separately each product for which data were reported and identifies the manufacturers.[1] The statistics shown in table 1 are for bulk chemicals only; finished pharmaceutical preparations and products put up in pills, capsules, tablets, or other measured doses are excluded.[2] The difference between production and sales reflects inventory changes, processing losses, and captive consumption of medicinal chemicals processed into ethical and proprietary pharmaceutical products by the primary manufacturer. In some instances, the difference may also include quantities of medicinal grade products used as intermediates, e.g., penicillin G salts used as intermediates in the manufacture of semisynthetic penicillins. All quantities are given in terms of 100-percent content of the pure bulk drug.

Total U.S. production of bulk medicinal chemicals in 1971 amounted to 223 million pounds, or 4.1 percent more than the 214 million pounds produced in 1970 amd 11.6 percent more than the 200 million pounds produced in 1969. Total sales of bulk medicinal chemicals in 1971 amounted to 152 million pounds, valued at $487 million, compared with sales in 1970 of 155 million pounds, valued at $510 million, and sales in 1969 of 145 million pounds, valued at $462 million. In terms of quantity, sales in 1971 were thus 1.4 percent smaller than in 1970 and 5.2 percent larger than in 1969. In terms of value, sales in 1971 were 4.6 percent smaller than in 1970 and 5.4 percent larger than in 1969.

Production of the more important groups of medicinal chemicals in 1971 was as follows: Antibiotics, 17.9 million pounds (5.7 percent larger than in 1970), of which 10.8 million pounds was for medicinal

[1] See table 3 for a list of manufacturers and their identification codes.

[2] Complementary statistics on the dollar value of manufacturers' shipments of finished pharmaceutical preparations, except biologicals, are published annually by the U.S. Department of Commerce, Bureau of the Census, in Current Industrial Reports, Series MA-28G. Many pharma ceutical manufacturers who report to the Bureau of the Census are excluded from the Tariff Commission report because they are not primary producers of medicinal chemicals, that is, they do not themselves produce the bulk drugs which go into their pharmaceutical products but purchase their drug requirements from domestic or foreign producers.

use and 7.1 million pounds was for other uses; anti-infective agents other than antibiotics, 31.7 million pounds (6.6 percent smaller than in 1970; central nervous system depressants and stimulants, 46.3 million pounds (7.2 percent smaller); gastrointestinal agents and therapeutic nutrients, 72.3 million pounds (9.4 percent larger); and vitamins, 26.1 million pounds (13.9 percent larger). Production of some of the more important individual products listed in table 1 was as follows: Choline chloride, 45.7 million pounds (15.5 percent larger than in 1970); aspirin, 31.7 million pounds (10.0 percent smaller); salicylic acid, 18.4 million pounds (30.5 percent larger); ascorbic acid, 11.2 million pounds (13.9 percent larger); anti-infective sulfonamides, 6.1 million pounds (2.0 percent larger); penicillins (except semi-synthetic), 4,670 trillion units (24.2 percent larger); tetracyclines, 2.2 million kilograms (5.9 percent smaller); vitamin A, 1,053 trillion units (17.3 percent smaller); and vitamin E, 982 billion units (63.7 percent larger).

[1] The data on production and sales are for bulk medicinal chemicals only; they *exclude* finished preparations and dosage-form products, which are manufactured from bulk chemicals. All quantities are given in terms of 100% active ingredient.

[2] Calculated from rounded figures.

[3] The term "benzenoid," as used in this report, describes any cyclic medicinal chemical whose molecule contains either a six-membered carbocylic ring with conjugated double bonds (e.g., the benzene ring or the quinone ring) or a six-membered heterocyclic ring with 1 or 2 hetero atoms and conjugated double bonds, except the pyrimidine ring (e.g., the pyridine ring or the pyrazine ring.)

[4] Includes antibiotics of unknown structure.

[5] With the exception of bacitracin, the penicillins (except semi-synthetic), and a few other antibiotics which were reported in terms of U.S.P. units, all quantities for antibiotics were reported as grams of antibiotic base. (Thus production of 480,900 grams of tetracycline hydrochloride, for example, would have been reported as 444,430 grams of tetracycline base.) For inclusion in the main statistical table, all quantities were converted from grams of antibiotic base to pounds of antibiotic base (453.6 grams = 1 pound) or from U.S.P. units to pounds (22.7 million units of bacitracin, 458 million units of procaine penicillin G, 723 million units of potassium penicillin G, etc. = 1 pound). The following tabulation shows statistics for all individually publishable antibiotics in terms of kilograms of antibiotic base (Kg.) or billions of U.S.P. units (BU):

Antibiotic	Unit of quantity	Production	Sales		
			Quantity	Value	Unit Value
				1,000 dollars	
Ampicillin, for medicinal use	-----Kg---	248,752	109,313	26,364	$241.18

Tetracyclines, for all uses	-----Kg---	2.182.735	484,346	22,493	46.44

[6] Production of all antibiotics for medicinal use amounted to 10,779,000 pounds; sales amounted to 4,063,000 pounds, valued at $104,693,000.

[7] Production of all antibiotics for animal feeds and other nonmedicinal uses amounted to 7,128,000 pounds; sales amounted to 2,609,000 pounds, valued at $32,048,000.

[8] Includes sales of antifungal agents.

[9] Includes production and sales of anticonvulsants, antitussives, general anesthetic, and stimulants; also includes sales of antidepressants, skeletal muscle relaxants, and tranquilizers.

[10] Sales of mercurial diuretics amounted to 293 pounds.

Footnotes for table 1--Continued

[11] All quantities for vitamin A, B_{12}, D, and E were reported in terms of grams or units, but were converted to pounds for inclusion in the main statistical table (1.317 billion units of vitamin A acetate, 0.824 billion units of vitamin A palmitate, 453.6 grams of vitamins B_{12}, 18.14 billion units of vitamin D, 617,000 units of d-alpha tocopheryl acetate, 454,000 units of dl-alpha tocopheryl acetate, etc. = 1 pound). The following tabulation shows statistics for these vitamins, except for B_{12}, which was not separately publishable, in terms of million of international units (MU) or billion of U.S.P. units (BU):

All other	----MU---	275,989	278,908	9,223	33.07

[12] Includes production and sales of antineoplastic agents, smooth-muscle relaxants, and unclassified medicinal chemicals; also includes sales of cardiovascular agents, and diagnostic agents.

FLAVOR AND PERFUME MATERIALS

Flavor and perfume materials are organic chemicals used to impart flavors and odors to foods, beverages, cosmetics and soaps. These aromatic chemicals are also utilized to neutralize or mask unpleasant odors in industrial processes and products as well as in consumer products.

Total domestic production of flavor and perfume materials in 1971 amounted to 96.4 million pounds -- a decrease by 3.9 percent from the 100.3 million pounds produced in 1970 (table 1).[1] Sales of these materials in 1971 amounted to 84.8 million pounds, valued at $84.0 million, compared with 91.5 million pounds, valued at $89.1 million in 1970.

Production of cyclic flavor and perfume materials in 1971 amounted to 49.7 million pounds; sales amounted to 42.2 million pounds, valued at $52.9 million. The individual chemical in the cyclic group produced in the greatest volume in 1971 again was benzyl alcohol (9.3 million pounds).

U.S. output of acyclic flavor and perfume materials in 1971 amounted to 46.7 million pounds; sales of these materials amounted to 42.6 million pounds, valued at $31.1 million. Monosodium glutamate was by far the most important of the acyclic chemicals, and the individual flavor and perfume chemical produced in the greatest volume. Output of this chemical in 1971 totaled 36.4 million pounds, compared with 37.2 million pounds in 1970.

[1] See also table 2 which lists these materials and identifies the manufacturers by codes. These codes are given in table 3.

SYNTHETIC ORGANIC CHEMICALS, 1971

PLASTICS AND RESIN MATERIALS

Plastics and resin materials are high molecular weight polymers which, at some stage in their manufacture, exist in such physical condition that they can be shaped or otherwise processed by the application of heat and pressure. Depending on the chemical composition, manufacturing process or intended use, the commercial products may contain plasticizers, fillers, extenders, stabilizers, coloring agents or other additives. Plastics materials may be molded, cast or extruded into semifinished or finished solid forms. Resin materials may be in the form of solutions, pastes or emulsions for applications such as protective coatings, adhesives, or paper and textile treatment.

Statistics on U.S. production and sales of synthetic plastics and resin materials for 1971 are given in table 1.[1] In general, the statistics follow the outline of the Tariff Commission's monthly report on the production and sales of synthetic plastics and resin materials (S.O.C. Series P-71); however, the data given include some resins and some companies which were not covered in the monthly reports and also some adjusted figures supplied by the original reporting companies. Consequently, many of the figures given in table 1 are revised from those shown in the Commission's monthly release dated February 16, 1972 containing 12-month cumulative totals for 1971. The end-use breakdowns shown were developed with the advice of representatives of the plastics industry, and the reported data reflect producers' determinations of the use categories for their materials.

U.S. production of plastics and resin materials in 1971 totaled 21,071 million pounds, or 9.7 percent more than the 19,210 million pounds produced in 1970. Sales in 1971 totaled 18,473 million pounds, valued at $3,507 million compared with 17,074 million pounds, valued at $3,266 million in 1970.

Thermosetting materials are those which harden with a change in composition in the final treatment so that they cannot again be softened by heat or solvents. U.S. production of thermosetting materials totaled 3,615 million pounds in 1971 compared with 3,525 million pounds in 1970. Production of the most important products in 1971 included phenolic resins (1,181 million pounds), amino (or urea and melamine) resins (770 million pounds), polyester resins (707 million pounds), and alkyd resins (543 million pounds).

Thermoplastic materials are those which can be repeatedly softened by heat and shaped. U.S. production of thermoplastic materials totaled 17,455 million pounds in 1971 compared with 15,685 million pounds in 1970. Production of the most important products in 1971 included polyethylene (6,381 million pounds), vinyl resins (4,103 million pounds), and styrene type materials (3,990 million pounds).

[1] Data for each specified end use are based on a percentage breakdown which includes captive consumption as well as sales by original producers, unless otherwise specified. To avoid disclosures of individual company operations, some totals are made equal to sales rather than sales-plus-use. Data for export sales include materials for all uses and exclude fabricated and semi-fabricated forms.

[2] Calculated from rounded figures.

[3] Dry weight basis unless otherwise specified. Dry weight basis is the total weight of the materials including resin and coloring agents, extenders, fillers, plasticizers, and other additives, but excluding water and other liquids diluents unless they are an integral part of the materials.

[4] Includes benzenoid plastics and resin materials as defined in part I of schedule 4 of the Tariff Schedules of the United States.

[5] Polyester resins are unsaturated alkyd resins, later to be copolymerized with a monomer (such as styrene or methyl methacrylate); and polyallyl resins (such as diallyl phthalate and diglycol carbonate). Data are on an "as sold" basis, including monomer if part of the resin system.

[6] Includes reactive diluents which are an integral part of the resin. Excludes the weight of hardeners sold in association with the resin as part of a two-component system.

[7] Data shown for modified and "advanced" epoxy resins are that part of the unmodified epoxy resins which is further processed.

[8] Data represent sales only.

[9] Sales and use data, and sales data broken down by end use, are from preliminary monthly reports and are not necessarily consistent with final annual data.

[10] Includes polycarbamate resins, toluenesulfonamide resins, acetone-formaldehyde resins, other thermosetting resins and their precursors, and sales of furfuryl-type resins.

[11] Does not include production or sales for fiber use.

[12] Includes data for ethylene copolymers. Sales do not include sales by primary producers to other primary producers; sales do include resales of purchased material by primary producers. Sales and use data are from preliminary monthly reports which are not necessarily consistent with final annual data.

[13] Data from preliminary monthly reports suggests that production was divided as follows: 40% straight polystyrene (solid), 42% rubber-modified polystyrene, 14% styrene-butadiene copolymers, and 4% other copolymers.

[14] Data are on the basis of dry resin content, excluding the weight of plasticizers, extenders, fillers, coloring agents, stabilizers or impact modifiers, unless otherwise noted.

[15] Data for polyvinyl acetate produced and sold in latex form include the weight of any protective colloids which are used as emulsion stabilizers and form an integral part of the resin system. Production does not include polyvinyl acetate used as a reactive intermediate for polyvinyl alcohol or other vinyl resins.

[16] Includes polyvinylidene chloride, polyvinyl butyral, polyvinyl formal, and other vinyl resins.

[17] Includes acetal resins, fluorocarbon resins, α-methylstyrene resins, polybutylene type resins, polycarbonate resins, polyester resins (saturated), polyimide-type resins, polyphenylene oxide type resins, polyterpene resins, other thermoplastics, and sales of non-nylon polyamide resins.

RUBBER-PROCESSING CHEMICALS

Rubber-processing chemicals are organic compounds that are added to natural and synthetic rubbers to give them qualities necessary for their conversion into finished rubber goods. In this report, statistics are given for cyclic and acyclic compounds, by use--such as accelerators, antioxidants, blowing agents, and peptizers. Data on production and sales of rubber-processing chemicals in 1971 are given in table 1.[1]

Production of rubber-processing chemicals as a group in 1971 amounted to 323 million pounds, or 8.4 percent more than the 298 million pounds reported for 1970. Sales of rubber-processing chemicals in 1971 amounted to 246 million pounds, valued at $159 million, compared with 228 million pounds, valued at $149 million, in 1970. The increased production and sales of rubber-processing chemicals in 1971 is attributable principally to the increased production and sales of cyclic antioxidants, antiozonants, and stabilizers.

The output of cyclic rubber-processing chemicals in 1971 amounted to 276 million pounds, or about 8.1 percent more than was reported for 1970. Sales in 1971 were 211 million pounds, valued at $143 million, compared with 196 million pounds, valued at $134 million in 1970. Of the total output of cyclic rubber-processing chemicals in 1971, accelerators accounted for 33.8 percent and antioxidants for 61.4 percent. Production of antioxidants, which amounted to 169.6 million pounds in 1971, included 119.8 million pounds of amino compounds and 49.8 million pounds of phenolic and phosphite compounds. Sales of amino antioxidants in 1971 were 95.6 million pounds, valued at $66.9 million; sales of phenolic and phosphite antioxidants were 32.6 million pounds, valued at $22.0 million.

Production of acyclic rubber-processing chemicals in 1971 amounted to 47.3 million pounds, an increase of 10.5 percent from the 42.8 million pounds reported for 1970. Sales in 1971 totaled 34.9 million pounds, valued at $16.8 million, compared with 31.4 million pounds, valued at $15.4 million, in 1970. Accelerators, principally dithiocarbamic acid derivatives and tetramethylthiuram sulfides, accounted for 48.2 percent of the output of acyclic rubber-processing chemicals for 1971. Dodecyl mercaptans accounted for 33.4 percent. Blowing agents, modifiers, shortstops, and lubricating and conditioning agents accounted for the remainder of the output of acyclic compounds.

ELASTOMERS

Elastomers (synthetic rubbers) are high polymeric materials with properties similar to those of natural rubber. The term "elastomers" as used in this report, means a substance, whether in bale, crumb, powder, latex, and other crude form, which can be vulcanized or similarly processed into a material that can be stretched to at least twice its original length and, after having been so stretched and the stress removed, will return with force to approximately its original length. U.S. production and sales of elastomers in 1971 are shown in table 1.[1]

Total U.S. production of synthetic elastomers in 1971 was 4,616 million pounds, an increase of 4 percent from that produced in 1970. The sales of these elastomers amounted to 4,031 million pounds (valued at $1,034 million) in 1971, an increase of more than 5 percent over 1970.

Styrene-butadiene rubber (SBR or S-type rubber) in 1971 continued to be the synthetic elastomer produced in the greatest quantity as it has been for more than 25 years. U.S. production of SBR, including 36 million pounds of its vinylpyridine sub-type, amounted to 2,578 million pounds in 1971. Solution polymerized butadiene rubber, a stereo type elastomer, was produced domestically in 1971 in the next largest amount--667 million pounds; production of isoprene and ethylene-propylene rubbers, the other stereo types, amounted to 264 million and 140 million pounds, respectively. Total U.S. production of these stereo type elastomers amounted to 1,071 million pounds in 1971--an increase of 2 percent over 1970. Other principal types of synthetic elastomers for which U.S. production and sales data are reported separately are isobutylene-isoprene (butyl) rubber, production of which was 231 million pounds in 1971, and acrylonitrile-butadiene (N-type) rubber, production of which was 141 million pounds.

U.S. production and sales data on synthetic organic chemicals are reported in terms of cyclic and acyclic structured compounds for purposes of better correlation with other statistical reporting systems. In 1971, U.S. production of cyclic elastomers amounted to 2,614 million pounds, an increase of nearly 7 percent over 1970; sales of cyclic elastomers amounted to 2,240 million pounds (valued at $484 million[2]), an increase in volume of 12 percent over 1970. U.S. production of acyclic elastomers in 1971 amounted to 2,002 million pounds, an increase of 1 percent over 1970; sales of acyclic elastomers amounted to 1,791 million pounds (valued at $550 million), a decrease in volume of nearly 2 percent from the previous year.

---

[1]See also table 2 which lists these products and identifies the manufacturers of each by code. These codes are given in table 3.

[2]The value of sales in 1971 for styrene-butadiene (S-type) rubber, which comprise about 90 percent of the sales value of cyclic elastomers, was calculated on a somewhat different basis than in previous years. The value of sales in 1971 for S-type elastomers is believed to have increased slightly over that in 1970, although the published figures show a decrease.

PLASTICIZERS

Plasticizers are organic chemicals that are added to synthetic plastics and resin materials to (1) improve workability during fabrication, (2) extend or modify the natural properties of these materials, or (3) develop new improved properties not present in the original material. Table 1 presents statistics on U.S. production and sales of plasticizers in as great detail as is possible without revealing the operations of individual producers.[1]

U.S. production of plasticizers totaled 1,494 million pounds in 1971, an increase of 11.8 percent from the 1,336 million pounds reported for 1970. Sales of plasticizers totaled 1,404 million pounds, valued at $258 million, in 1971, compared with 1,239 million pounds, valued at $235 million, in 1970.

Production of cyclic plasticizers in 1971, which consisted chiefly of the esters of phthalic anhydride and phosphoric acid, amounted to 1,130 million pounds, an increase of 13.2 percent from the 998 million pounds reported for 1970. Sales of cyclic plasticizers in 1971 totaled 1,075 million pounds, valued at $158 million, compared with 938 million pounds, valued at $144 million, in 1970. The most important cyclic plasticizer was di(2-ethylhexyl) phthalate, with production of 386 million pounds, in 1971.

Production of acyclic plasticizers in 1971 totaled 364 million pounds, an increase of 7.7 percent from the 338 million pounds reported for 1970. Sales of acyclic plasticizers totaled 330 million pounds, valued at $100 million, in 1971, compared with 302 million pounds, valued at $91 million, in 1970. Epoxidized esters were the most important group in 1971 with production of 99 million pounds.

[1] See also table 2 which lists these products and identifies the manufacturers by code. These codes are given in table 3.

SYNTHETIC ORGANIC CHEMICALS, 1971

SURFACE-ACTIVE AGENTS

The surface-active agents included in this report are organic chemicals that reduce the surface tension of water or other solvents and are used chiefly as detergents, dispersing agents, emulsifiers, foaming agents, or wetting agents in either aqueous or nonaqueous systems. Waxes and products used chiefly as plasticizers are excluded. Surface-active agents are produced from natural fats and oils; from silvichemicals such as lignin, rosin, and tall oil; and from chemical intermediates derived from coal tar and petroleum. A major part of the output of the bulk chemicals shown in this report is consumed in the form of packaged soaps and detergents for household and industrial use. The remainder is used in the processing of textiles and leather, in ore flotation and oil-drilling operations, and in the manufacture of agricultural sprays, cosmetics, elastomers, foods, lubricants, paints, pharmaceuticals, and many other products.

Table 1 shows statistics for production and sales of surface-active agents grouped by ionic class and by chemical class and subclass; table 2 lists these products and identifies the manufacturers.[1] All quantities are reported in terms of 100-percent organic surface-active ingredient and thus exclude all inorganic salts, water, and other diluents. Sales statistics reflect sales of bulk surface-active agents only; sales of formulated products are excluded.

Total U.S. production of surface-active agents in 1971 amounted to 3,828 million pounds, or 1.5 percent less than the 3,886 million pounds reported for 1970. Sales of bulk surface-active agents in 1971 amounted to 2,186 million pounds, valued at $422 million, compared with sales in 1970 of 2,061 million pounds, valued at $387 million. In terms of quantity, sales in 1971 were thus 6.0 percent larger than in 1970; in terms of value, sales in 1971 were 9.1 percent larger than in 1970.

Production of anionic surface-active agents in 1971 amounted to 2,595 million pounds, or 67.8 percent of the total output reported for 1971 and 4.9 percent less than the anionic output reported for 1970. Sales of anionics in 1971 amounted to 1,223 million pounds, valued at $187 million. Of the total anionic output, 859 million pounds consisted of potassium and sodium salts of fatty, rosin, and tall oil acids, of which 465 million pounds was the sodium salt of tallow acids and 115 million pounds was the sodium salt of coconut oil acids; 646 million pounds consisted of alkylbenzenesulfonates, of which 361 million pounds was sodium dodecylbenzenesulfonate, 115 million pounds was dodecylbenzenesulfonic acid, and 138 million pounds was sodium tridecylbenzenesulfonate; 508 million pounds consisted of ligninsulfonates, of which 328 million pounds was the calcium salt; and 167 million pounds consisted of sulfated ethers.

Production of nonionic surface-active agents in 1971 amounted to 1,021 million pounds, or 26.7 percent of the total output reported for 1971 and

---

[1] See table 3 for a list of manufacturers and their codes.

10.6 percent more than the nonionic output reported for 1970. Sales of nonionics in 1971 amounted to 786 million pounds, valued at $162 million. Of the total nonionic output, 273 million pounds consisted of alkylphenol ethoxylates and other benzenoid ethers, of which 148 million pounds was nonylphenol ethoxylate; 463 million pounds consisted of alcohol ethoxylates and other nonbenzenoid ethers, of which 368 million pounds was mixed linear alcohol ethoxylate; 104 million pounds consisted of glycerol esters; and 81 million pounds consisted of alkanolamides.

Production of cationic surface-active agents in 1971 amounted to 203 million pounds, or 5.3 percent of the total output reported for 1971 and 11.2 percent less than the cationic output reported for 1970. Sales of cationics in 1971 amounted to 167 million pounds, valued at $67 million. Of the total cationic output, 52 million pounds consisted of quaternary ammonium salts not containing oxygen, and 58 million pounds consisted of amines not containing oxygen.

Production of amphoteric surface-active agents in 1971 amounted to 9.9 million pounds, or 0.3 percent of the total output reported for 1971 and 29.6 percent more than the amphoteric output reported for 1970. Sales of amphoterics in 1971 amounted to 9.7 million pounds, valued at $6.6 million.

The difference between production and sales reflects inventory changes and captive consumption of soaps and surface-active agents by synthetic rubber producers, and by manufacturers of cosmetics, packaged detergents, bar soaps, and other formulated consumer products. In some instances the difference may also reflect quantities of surface-active agents used as chemical intermediates, e.g., nonionic alcohol and alkylphenol ethoxylates which may be converted to anionic surface-active agents by phosphation or sulfation.

PESTICIDES AND RELATED PRODUCTS

Pesticides and related products include fungicides, herbicides, insecticides, rodenticides, and related products such as plant hormones, seed disinfectants, soil conditioners, soil fumigants and synergists. The data are given in terms of 100-percent active material; they thus exclude such materials as diluents, emulsifiers, and wetting agents.

U.S. production of pesticides and related products in 1971 amounted to 1,136 million pounds--9.8 percent greater than the 1,034 million pounds reported for 1970 (table 1) 1/. Sales in 1971 were 946 million pounds, valued at $979 million, compared with 881 million pounds, valued at $870 million in 1970.

The output of cyclic pesticides and related products amounted to 828 million pounds in 1971--about 13.8 percent greater than the 727 million pounds produced in 1970. Sales in 1971 were 669 million pounds, valued at $819 million, compared with 602 million pounds, valued at $702 million in 1970. Production of acyclic pesticides and related products, increased slightly in 1971, amounting to 308 million pounds, compared with the 307 million pounds reported for 1970. Sales in 1971 were 277 million pounds, a decrease of about 0.7 percent as compared to 279 million pounds in 1970; the value of sales was $160 million in 1971, compared with $169 million in 1970--a decrease of 5 percent.

1/ See also table 2 which lists these products and identifies the manufacturers by codes. These codes are given in table 3.

MISCELLANEOUS CHEMICALS

The term miscellaneous chemicals comprises those synthetic organic products that are not included in the use groups covered by the other preliminary reports in the 1971 series. They include products that are employed in a great variety of uses. The number of chemicals used exclusively for only one purpose is not large. Among the products covered are those used for gasoline and lubricating oil additives, paint driers, photographic chemicals, tanning materials, flotation reagents, refrigerants, textile polymers, sequestering agents, organic fertilizers, antifreeze chemicals, solvents, and acyclic intermediates. Table 1 presents statistics on U.S. production and sales of miscellaneous chemicals in as great detail as is possible without revealing the operations of individual producers.[1]

Production of miscellaneous cyclic and acyclic chemicals in 1971 totaled 79.5 billion pounds, or 0.3 percent more than the output of 79.3 billion pounds reported for 1970. Sales of miscellaneous chemicals in 1971 amounted to 38.4 billion pounds, valued at $4.1 billion, compared with 36.0 billion pounds, also valued at $4.1 billion, in 1970.

The total output of miscellaneous cyclic chemicals in 1971 was 2.2 billion pounds, or 27.8 percent more than the output of 1.7 billion pounds reported for 1970. Sales in 1971 totaled 1.0 billion pounds, valued at $379 million, compared with 749 million pounds, valued at $310 million, in 1970. In 1971 the most important groups of cyclic compounds were the lubricating oil additives, the output of which was 370 million pounds, and synthetic tanning materials, the output of which was 50 million pounds.

Total production of miscellaneous acyclic chemicals in 1971 was 77.3 billion pounds, or 0.3 percent less than the output of 77.6 billion pounds reported for 1970. Sales in 1971 totaled 37.3 billion pounds, valued at $3.8 billion, compared with 35.2 billion pounds, also valued at $3.8 billion, in 1970. The statistics for acyclic chemicals are grouped primarily by chemical function. The order of precedence of these functional groups is generally that used in naming and indexing chemical compounds by *Chemical Abstracts*, but other important considerations are comparability with other statistics and the need for groupings that will not reveal the operations of individual producers.

In 1971, the most important groups of acyclic chemicals were the halogenated hydrocarbons, the nitrogenous compounds, monohydric alcohols, and aldehydes and ketones. Production of halogenated hydrocarbons, which are used as solvents, intermediates, refrigerants, and aerosol propellants, totaled 18.9 billion pounds. The most important chemicals in this group were dichloroethane (production of 7.6 billion pounds in 1971 compared with

7.5 billion pounds in 1970) and vinyl chloride (4.3 billion pounds compared with 4.0 billion pounds). Output of nitrogenous compounds totaled 13.5 billion pounds. The most important chemical in this group was urea (used principally in fertilizers and as a feed additive), production of which was 6.2 billion pounds in both 1971 and 1970.

Monohydric alcohols, which are used largely as solvents and intermediates, were the third largest group in 1971, with production of 10.7 billion pounds. The most important items in the group in terms of production were synthetic methanol (4.9 billion pounds in both 1971 and 1970), synthetic ethyl alcohol (1.6 billion pounds in 1971, compared with 2.0 billion pounds in 1970) and isopropyl alcohol (1.7 billion pounds in 1971, compared with 1.9 billion pounds in 1970). Aldehydes and ketones, which are also used largely as solvents and intermediates, were the next largest group with production of 9.6 billion pounds. The most important items in this group in 1971 were formaldehyde (4.5 billion pounds), acetaldehyde (1.5 billion pounds), and acetone (1.5 billion pounds).

U.S. IMPORTS OF BENZENOID CHEMICALS AND PRODUCTS

U.S. general imports of benzenoid chemicals and products entered under the Tariff Schedules of the United States (TSUS), schedule 4, part 1, subparts B and C are analyzed by the Tariff Commission annually and published in detail in a separate report.[1] General imports of benzenoid items entered in parts 1B and 1C totaled 219.5 million pounds with a foreign invoice value of $185.0 million in 1971 compared with 193.7 million pounds with a foreign invoice value of $135.2 million in 1970.

Benzenoid products that are "competitive" with similar domestic products, because they accomplish results substantially equal to those accomplished by the similar domestic product when used in substantially the same manner, are subject to a special basis of valuation for customs purposes known as the "American selling price." If "noncompetitive," the benzenoid products are valued for customs purposes on the basis of the "United States value." The essential difference between these two values is that "American selling price" is based on the wholesale price in the United States of the "competitive" domestic product, whereas "United States value" is based on the wholesale price in the United States of the imported product less most of the expenses incurred in bringing the product to the United States and selling it. When neither of these two valuation bases applies, then the "export value," "foreign value," or "constructed value" is used as the valuation basis under section 402 or 402a, Tariff Act of 1930, as amended. The competitive status of benzenoid imports in 1971 is shown in table 2.

Industrial organic chemicals that are entered under part 1B consist chiefly of benzenoid intermediates and small quantities of acyclic compounds which are derived in whole or in part from benzenoid compounds. Also included are mixtures and small quantities of finished products not specially provided for in part 1C (e.g., rubber-processing chemicals). In terms of value, 42.6 percent of all the benzenoid imports under part 1B in 1971 came from West Germany; 25.6 percent, from Japan; 8.4 percent, from Italy; and 8.3 percent from Switzerland.

Finished organic chemical products entered under part 1C include dyes, pigments, medicinals, flavor and perfume materials, pesticides, plastics materials, and certain other specified products. In terms of value, 39.3 percent of all finished benzenoid imports under part 1C in 1971 came from West Germany; 21.2 percent, from Switzerland; 13.9 percent, from the United Kingdom; and 8.5 percent from Japan.

Note.--The totals shown in this table differ from those given in the official statistics of the U.S. Department of Commerce chiefly because of differences in coverage and in the methods used in compiling the data. In general, the statistical coverage in 1971 varies from a low of 75 percent for drugs to almost complete coverage for intermediates, dyes, and pigments.
